

One Day Workshop in Web Development

Objectives

- Understand the basic principles of HTML, CSS and JAVASCRIPT
- Learn the basic functions of the **Atom text editor** to create HTML, CSS, and JAVASCRIPT files
- Create a simple website with HTML, CSS, and JAVASCRIPT
- Master the basic operation of **Github Desktop** — a version control program to upload your works to the Github website

Software Tools for the Workshop

- **Atom Text Editor** (can be downloaded from <https://atom.io>)
- **Github Desktop**
(can be downloaded from <https://desktop.github.com>)

A T O M

1.30.0

[Release notes](#)

macOS

For macOS 10.9 or later

 **Download**

By downloading, you agree to the [Terms and Conditions](#).

[Other platforms](#)

[Try Atom Beta](#)

A hackable **text editor** for the 21st Century

[Real-time collaboration](#)

[IDE features](#)

[Git and GitHub Integration](#)

[Overview](#) [Release Notes](#) [Help](#)

The new native

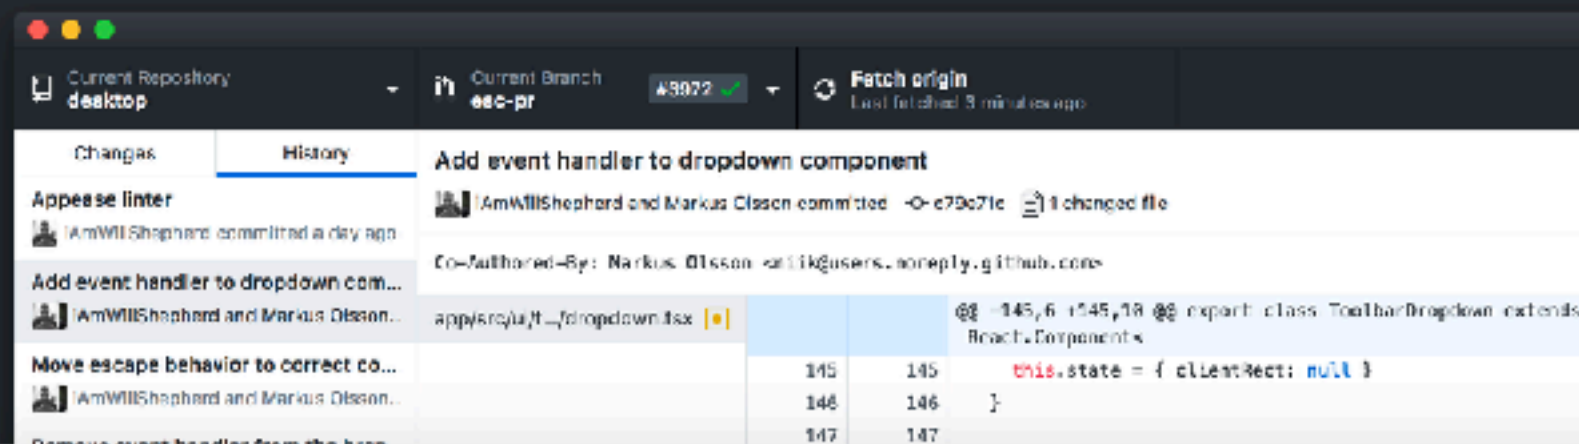

Extend your GitHub workflow beyond your browser with GitHub Desktop, completely redesigned with Electron. Get a unified cross-platform experience that's completely open source and ready to customize.

[Download for macOS](#)

[Download for Windows](#)

By downloading, you agree to the [Open Source Applications Terms](#).

Let's Begin

- Sign-up for a **Github** account (the free account)
- Install **Github Desktop** and create a new repository (You can treat the repository as a folder) by creating a new folder associated with it.
- Install **Atom text editor** and open the **Github repository** (i.e. folder) with it.
- You can start creating HTML, CSS, and JAVASCRIPT files with **Atom** and maintain your the **remote** Github and **local** repository for code development and version control.

Let's Begin

NOUN

HTML

ADJECTIVE

CSS

VERB

JS

What does HTML stand for?

(H)yper (T)ext (M)arkup (L)anguage

(M)arkup is a collection of “tags”.

NOUN

HTML

<html>, <head>, <title>, <meta>, <style>, <script>, <body>, <header>, <footer>, <nav>, <main>, <section>, <aside>, <p>,
, <a>, , , , <table>, <div>, <form>

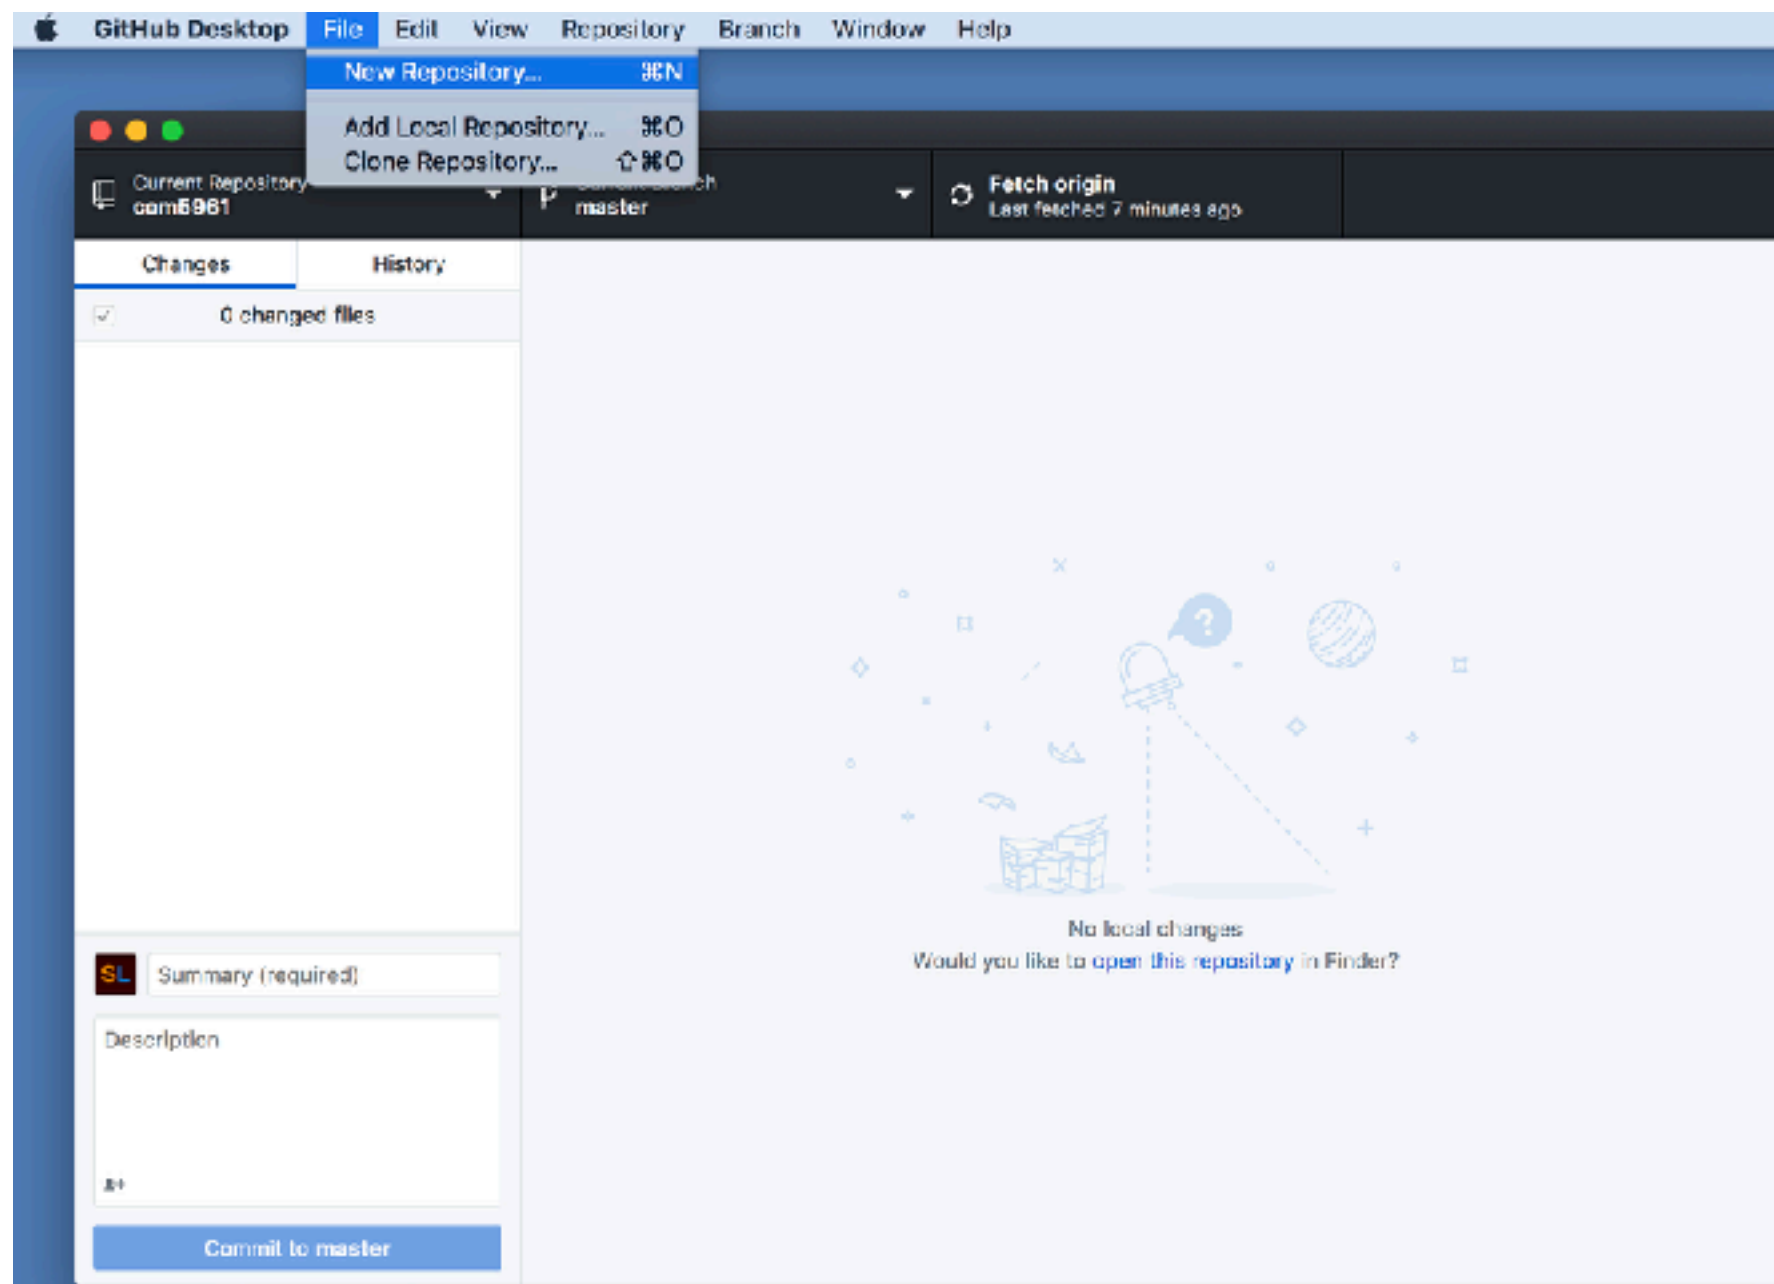

Elements
has
attributes

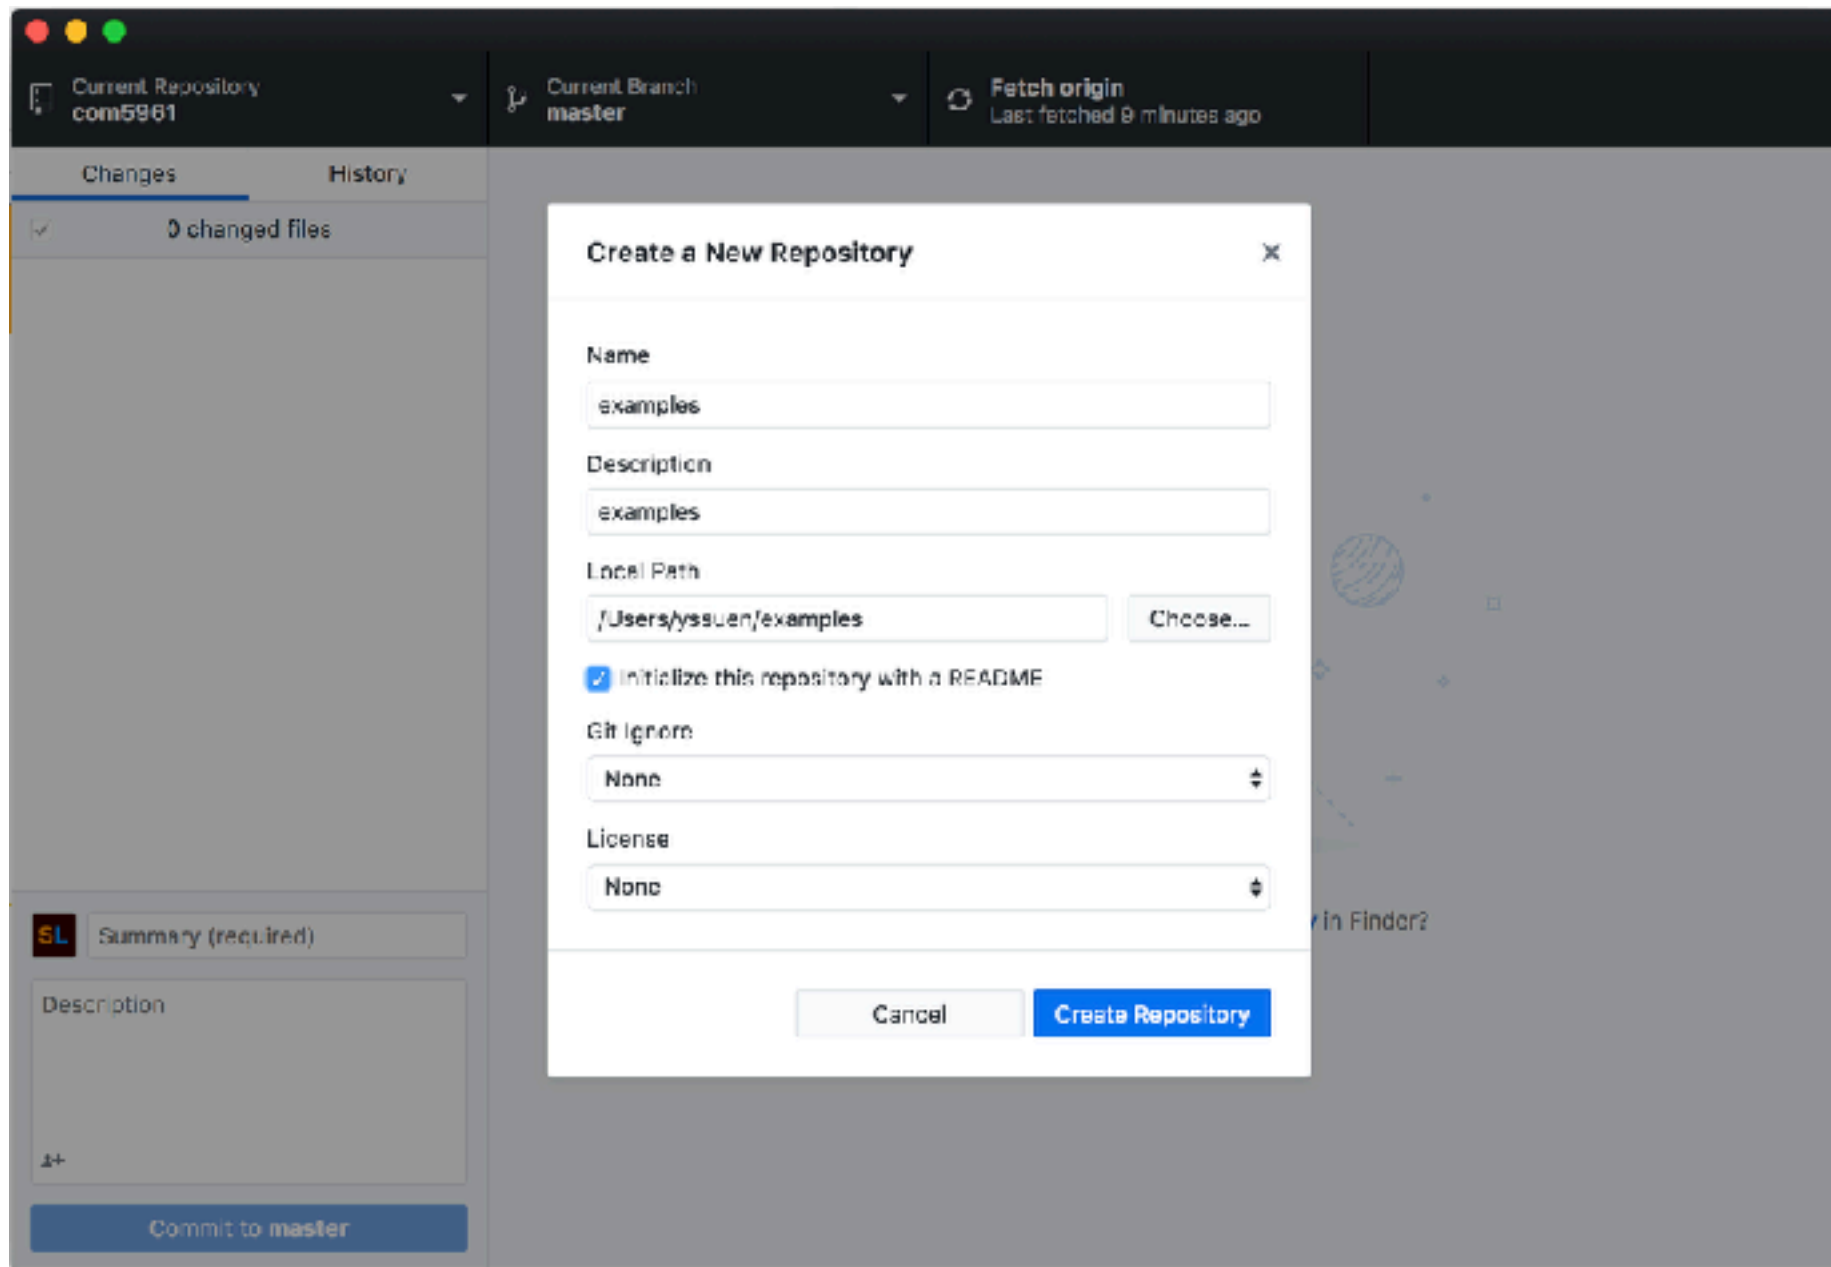

(e.g. color, background-color, position, font-family, font-size, font-style, display, width, margin, border, padding)

First hands-on exercise:

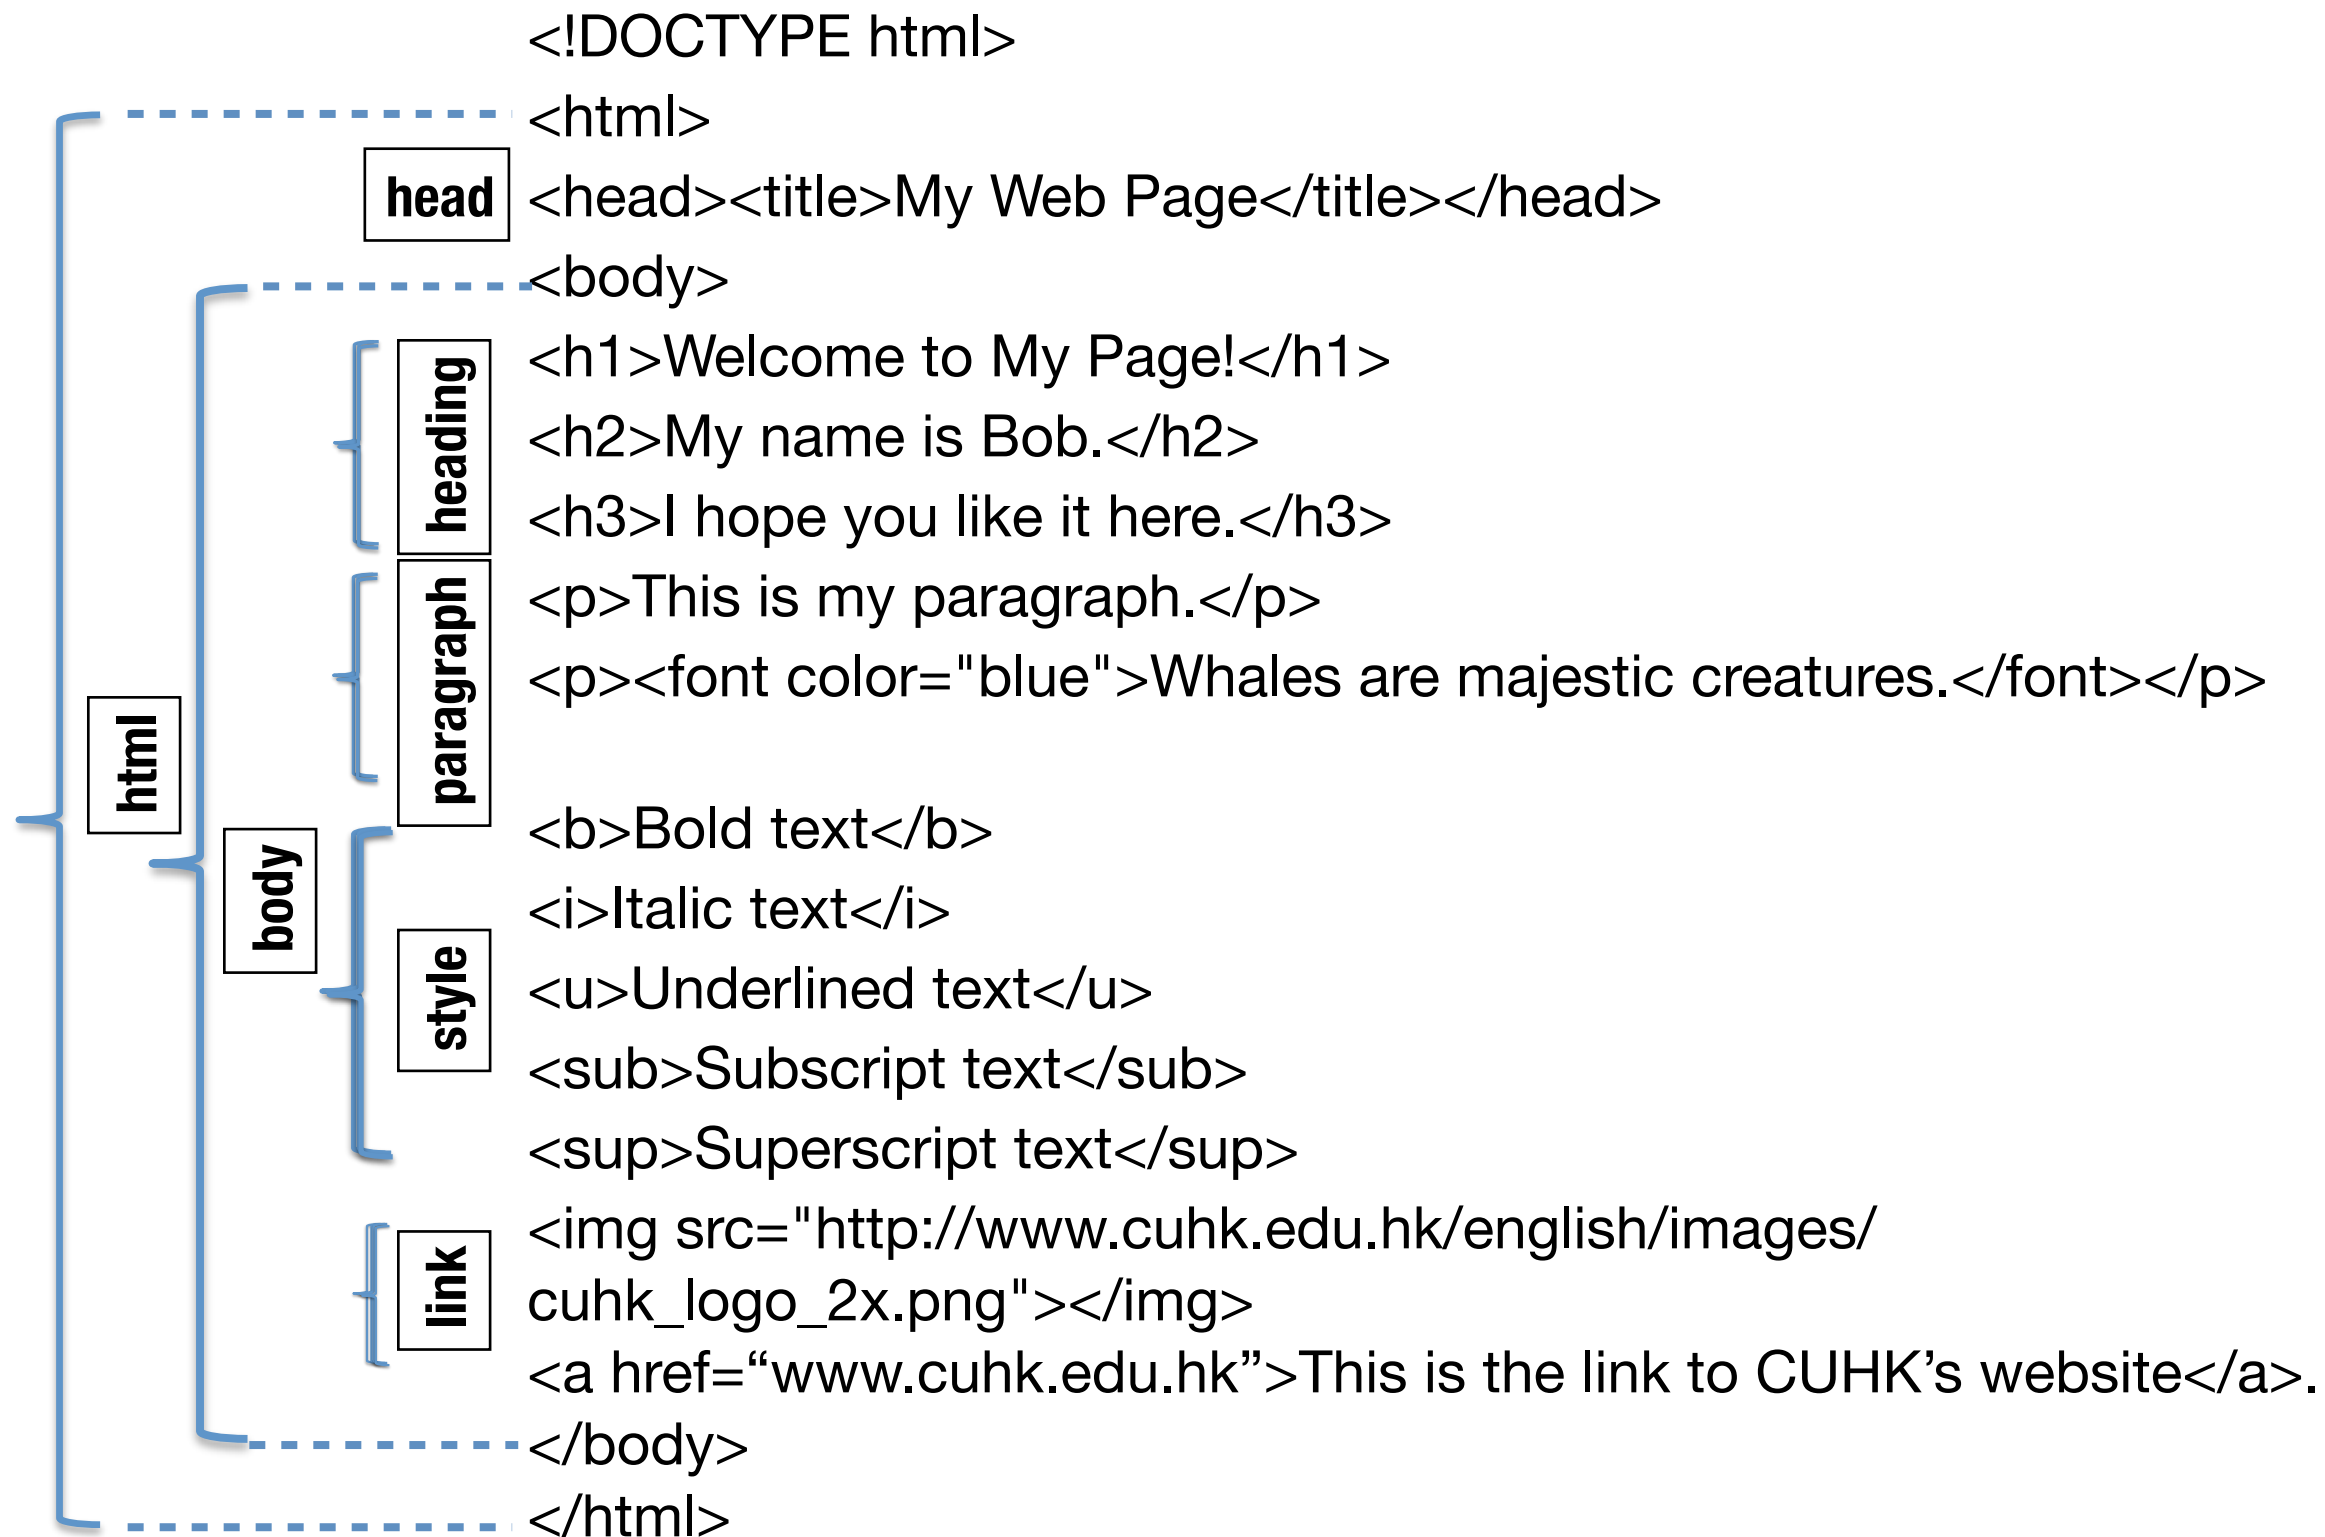

<https://www.wikihow.com/Create-a-Simple-Web-Page-with-HTML> (Step 1 to Step 13)

Congratulation. You created your 1st html document (example1.html). Now it's time to upload it to your remote Github account space.

My first styled page

Welcome to my styled page!

It lacks images, but at least it has style. And it has links, even if they don't go anywhere...

There should be more here, but I don't know what yet.

Made 5 April 2004
by myself.

The screenshot displays a web browser window with the page title "My first styled page". The browser's developer tools are open, showing the HTML structure on the left and the CSS styles on the right.

HTML Structure:

```
<html>
<head>
  <title>My first styled page</title>
  <link rel="stylesheet" type="text/css" href="style.css">
</head>
<body>
  <!-- Site navigation menu -->
  <ul class="navbar">...</ul>
  <!-- Main content -->
  ... <h1>My first styled page</h1> == $0
  <p>Welcome to my styled page!
  </p>
  <p>...</p>
  <p>...</p>
  <address>...</address>
</body>
```

The `<link rel="stylesheet" type="text/css" href="style.css">` tag is highlighted with a dashed box. The `<h1>My first styled page</h1>` element is selected, and its styles are shown on the right.

CSS Styles:

Style	Computed
element.style { }	
h1 { style.css:1 }	
border-style	solid;
border-width	7px;
border-color	black;
padding	20px;
text-align	center;
background-color	cadetblue;
color	white;

The browser's breadcrumb at the bottom shows the path: `html > body > h1`.

```

Put the Internal Style Definition into an External File

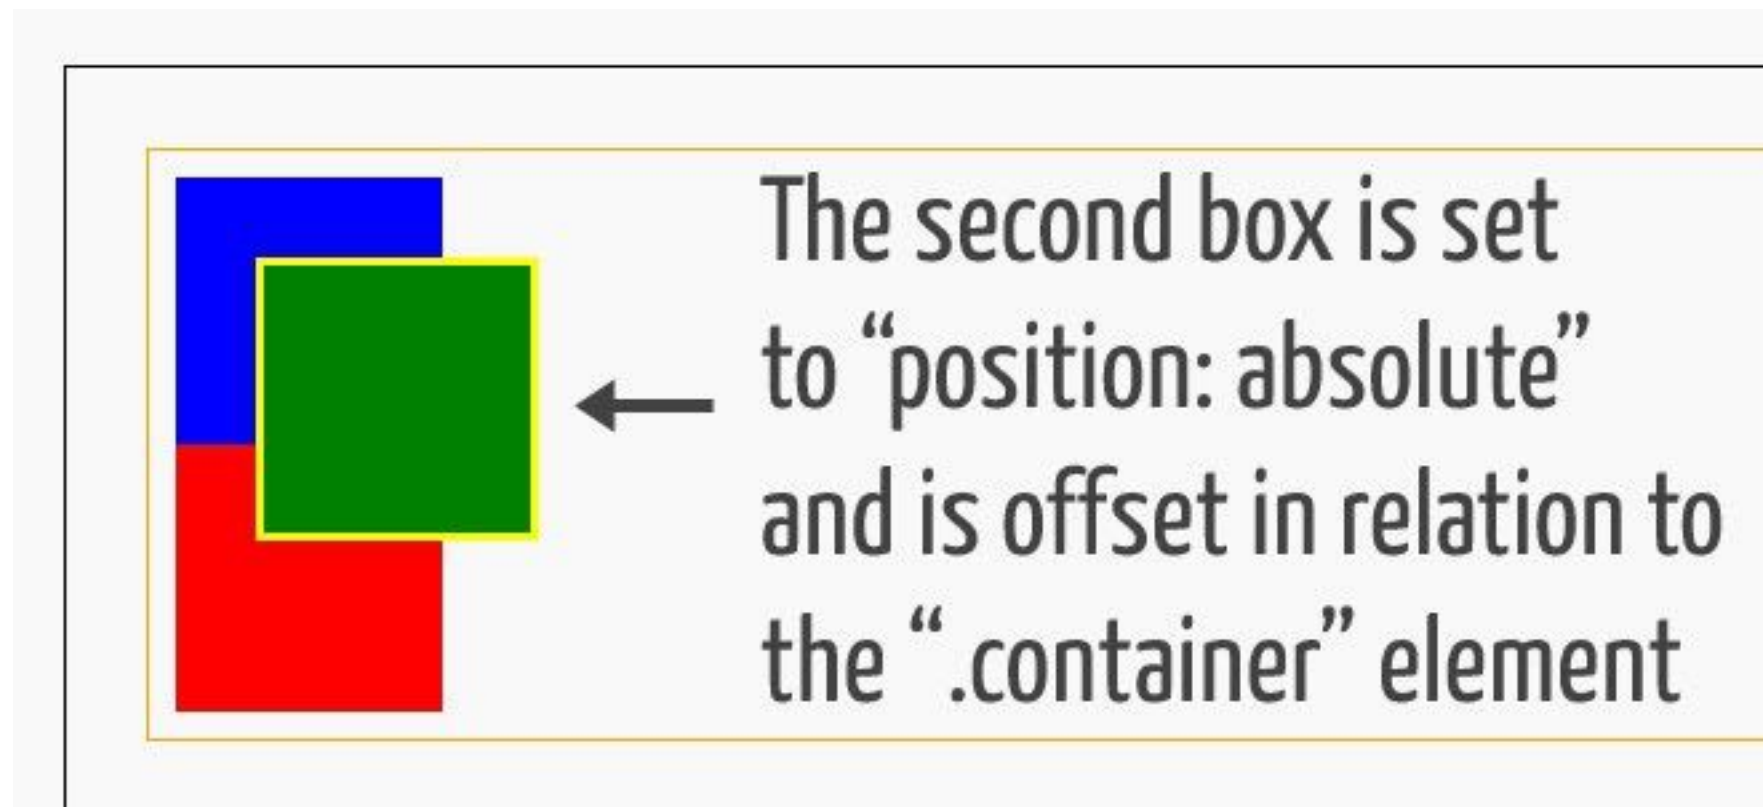

4 Ways of Positioning Display Box

- Static - default position of a box following the normal document flow (not affected by top, left, right, bottom pos.)
- Fixed - it always stay on the same location as defined by the positions (top and left or bottom or right) even the page is scrolled. Unlike absolute, its parent is the viewport.
- Relative - relative when used with top and left position pair or bottom and right position pair will allow the object box to be moved to a new location relative to its current position (not container).
- Absolute - take the positioning out of the document flow and place it at a location (top and left position) as defined in relationship to its containing (or parent) element (context). The container/parent should be set to relative.

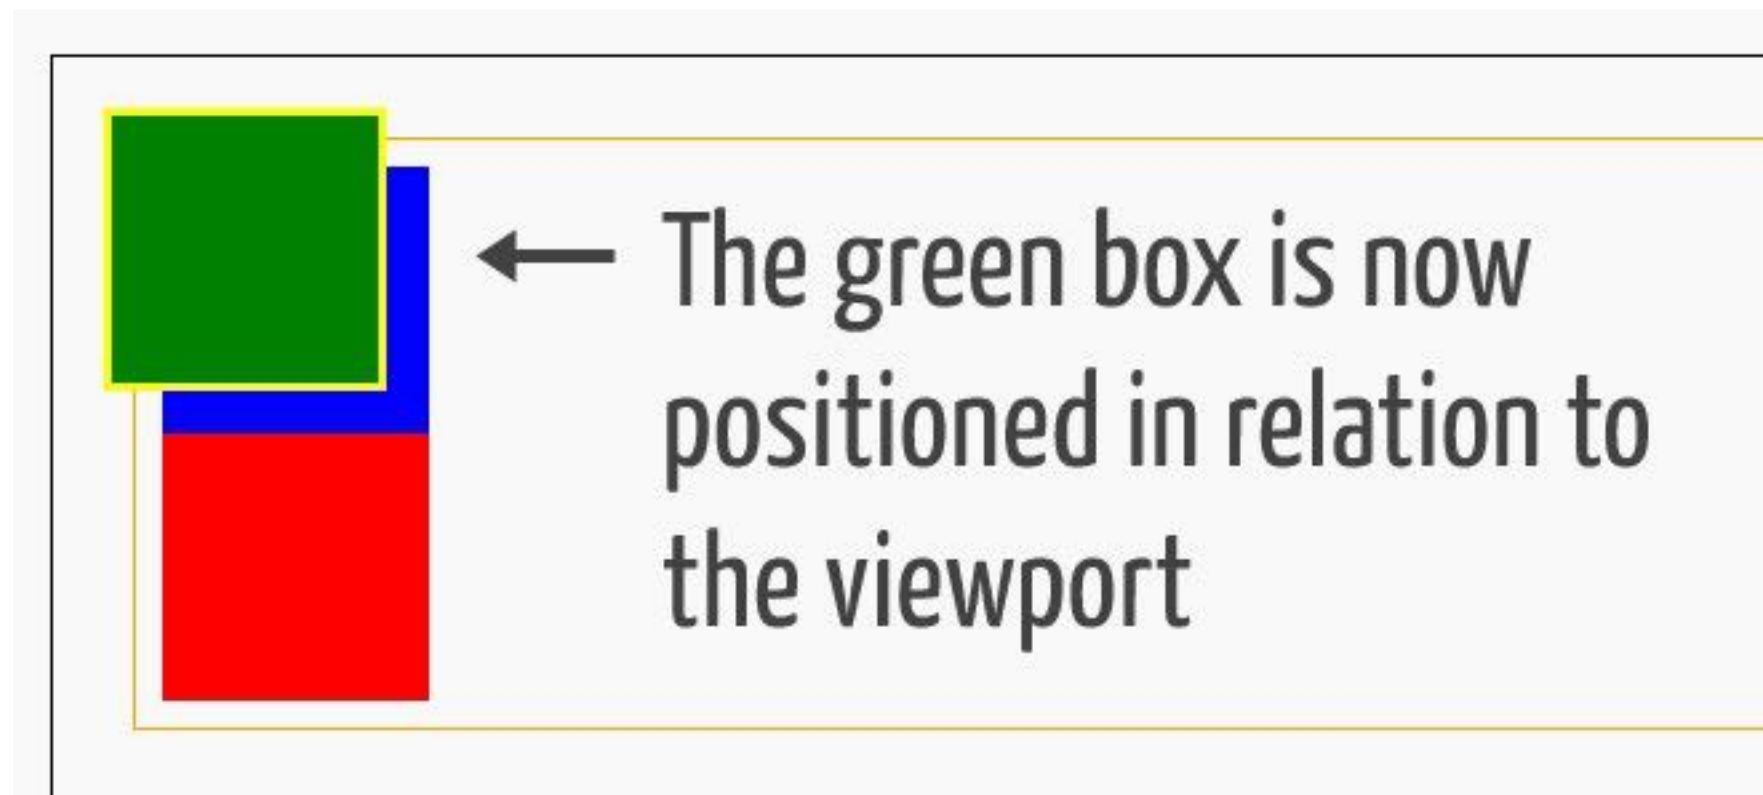

The second box is
set to “position: relative”
and is offset using
top and left values.

Box 1

Box 2

Box 3

A Simple Example

The Grammar of CSS

- Styles define how to display HTML elements
- Each style description is made up of a Selector and Declaration
- Selector defines which HTML element should be used for display and the declaration defines how
- Each declaration contains properties and values
- There are base and custom selectors (ID and CLASS are custom selectors)
- Style definition can be placed inline, in the head section or in an external file (e.g. style.css)

VERB

JS

JavaScript = act on a HTML tag, CSS property or respond to an event triggered by user action

Understanding Computational Thinking as Foundation to JavaScript Programming

What is “Computational Thinking”?

Bitesize

Home > KS3 > Computer Science > Computational thinking

Introduction to computational thinking

Before computers can be used to solve a problem, the problem itself and the ways in which it could be resolved must be understood. Computational thinking techniques help with these tasks.

Revise

Test

< 1 2 >

What is computational thinking?

Computers can be used to help us solve problems. However, before a problem can be tackled, the problem itself and the ways in which it could be solved need to be understood.

Computational thinking allows us to do this.

More Guides

Introduction to computational thinking

Decomposition

Pattern recognition

Abstraction

Algorithms

Evaluating solutions

Decomposition

Pattern

Abstraction

Algorithm

Automation &
Testing

Decomposition

Break a problem down into smaller parts.

Pattern

Discover similarities between things.

Abstraction

Ignore irrelevant details to focus on essential features to come up with one solution or classification that works for multiple situations.

Algorithm

Specify a sequence of steps that someone or computer can follow to complete a task.

Automation & Testing

Codify and test the algorithm for automated execution by the computer.

How Google used computational thinking to develop Google Earth

First warm up problem for computational thinking.

Summing up all the integers from 1 to 200
in your head in 30 seconds.

$$1 + 2 + 3 + \dots + 198 + 199 + 200$$

Decomposition

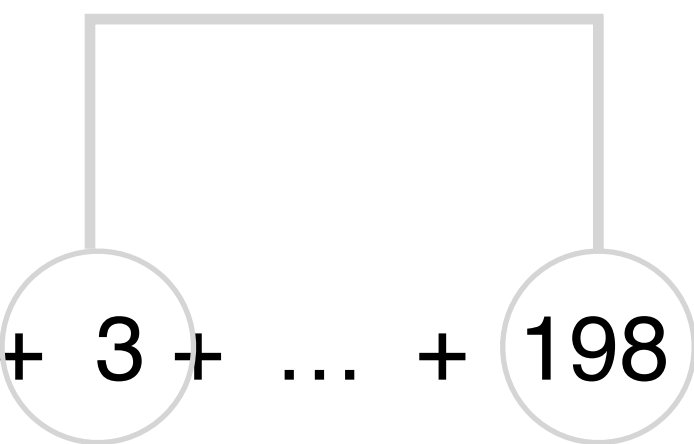

$$1 + 2 + 3 + \dots + 198 + 199 + 200$$

The diagram illustrates the pairing of terms in an arithmetic series. A horizontal line with vertical end-caps connects the number 2 and the number 199, which are each enclosed in a light gray circle. The entire expression is $1 + 2 + 3 + \dots + 198 + 199 + 200$.

$$1 + 2 + 3 + \dots + 198 + 199 + 200$$

Pattern

$$1 + 2 + 3 + \dots + 198 + 199 + 200$$

A diagram illustrating a summation sequence. The sequence is $1 + 2 + 3 + \dots + 198 + 199 + 200$. The terms 3 and 198 are circled, and a horizontal line with vertical end caps connects them, indicating a pairing or abstraction of these terms.

$$1 + 2 + 3 + \dots + 198 + 199 + 200$$

$$\frac{200 \times (201)}{2}$$

Abstraction

- Can we do it easily with 2,000?
- How about 20,000?
- What stays the same? What is different?

$$\frac{200 \times (201)}{2}$$

Abstraction

- Work through the problem we ultimately get ? = ("blank"/2) * ("blank"+1)

- Can we do it easily with 2,000?
- How about 20,000?
- What stays the same? What is different?

$$\frac{200 \times (201)}{2}$$

Abstraction

$$\frac{X \times (X+1)}{2}$$

Algorithm

- Can we do it easily with 2,000?
- How about 20,000?
- What stays the same? What is different?

$$\frac{200 \times (201)}{2}$$

Abstraction

$$\frac{X \times (X+1)}{2}$$

Algorithm

Algorithm = function

variable

$$Y = f(X) \quad 20,100 = \frac{X}{2} \times (X+1)$$

Table 1

	X	200	
	X+1	201	
	X/2	100	
	(X+1)x(X/2)	20,100	

Automate & Test in a Spreadsheet

**Computational thinking is about
system and data.**

What is JavaScript? How does it fit into computational thinking?

$$Y = f(X)$$

Example: Cell manipulation in Excel with some cells controlling inputs while others outputs.

JavaScript provides us with the capabilities to build system and transform data.

Data Types in JavaScript

Declaring a variable and its data type:

- **String** - e.g. **var str_var = "This is a string.";**
- **Numeric** - e.g. **var num_var = 3.2;**
- **Boolean** - e.g. **var bol_var = true;**

Basic Input/Output Commands

- Entering a variable - e.g. **var x = prompt("Enter x value");**
- Displaying a variable - e.g. **alert("x = " + x_var);**

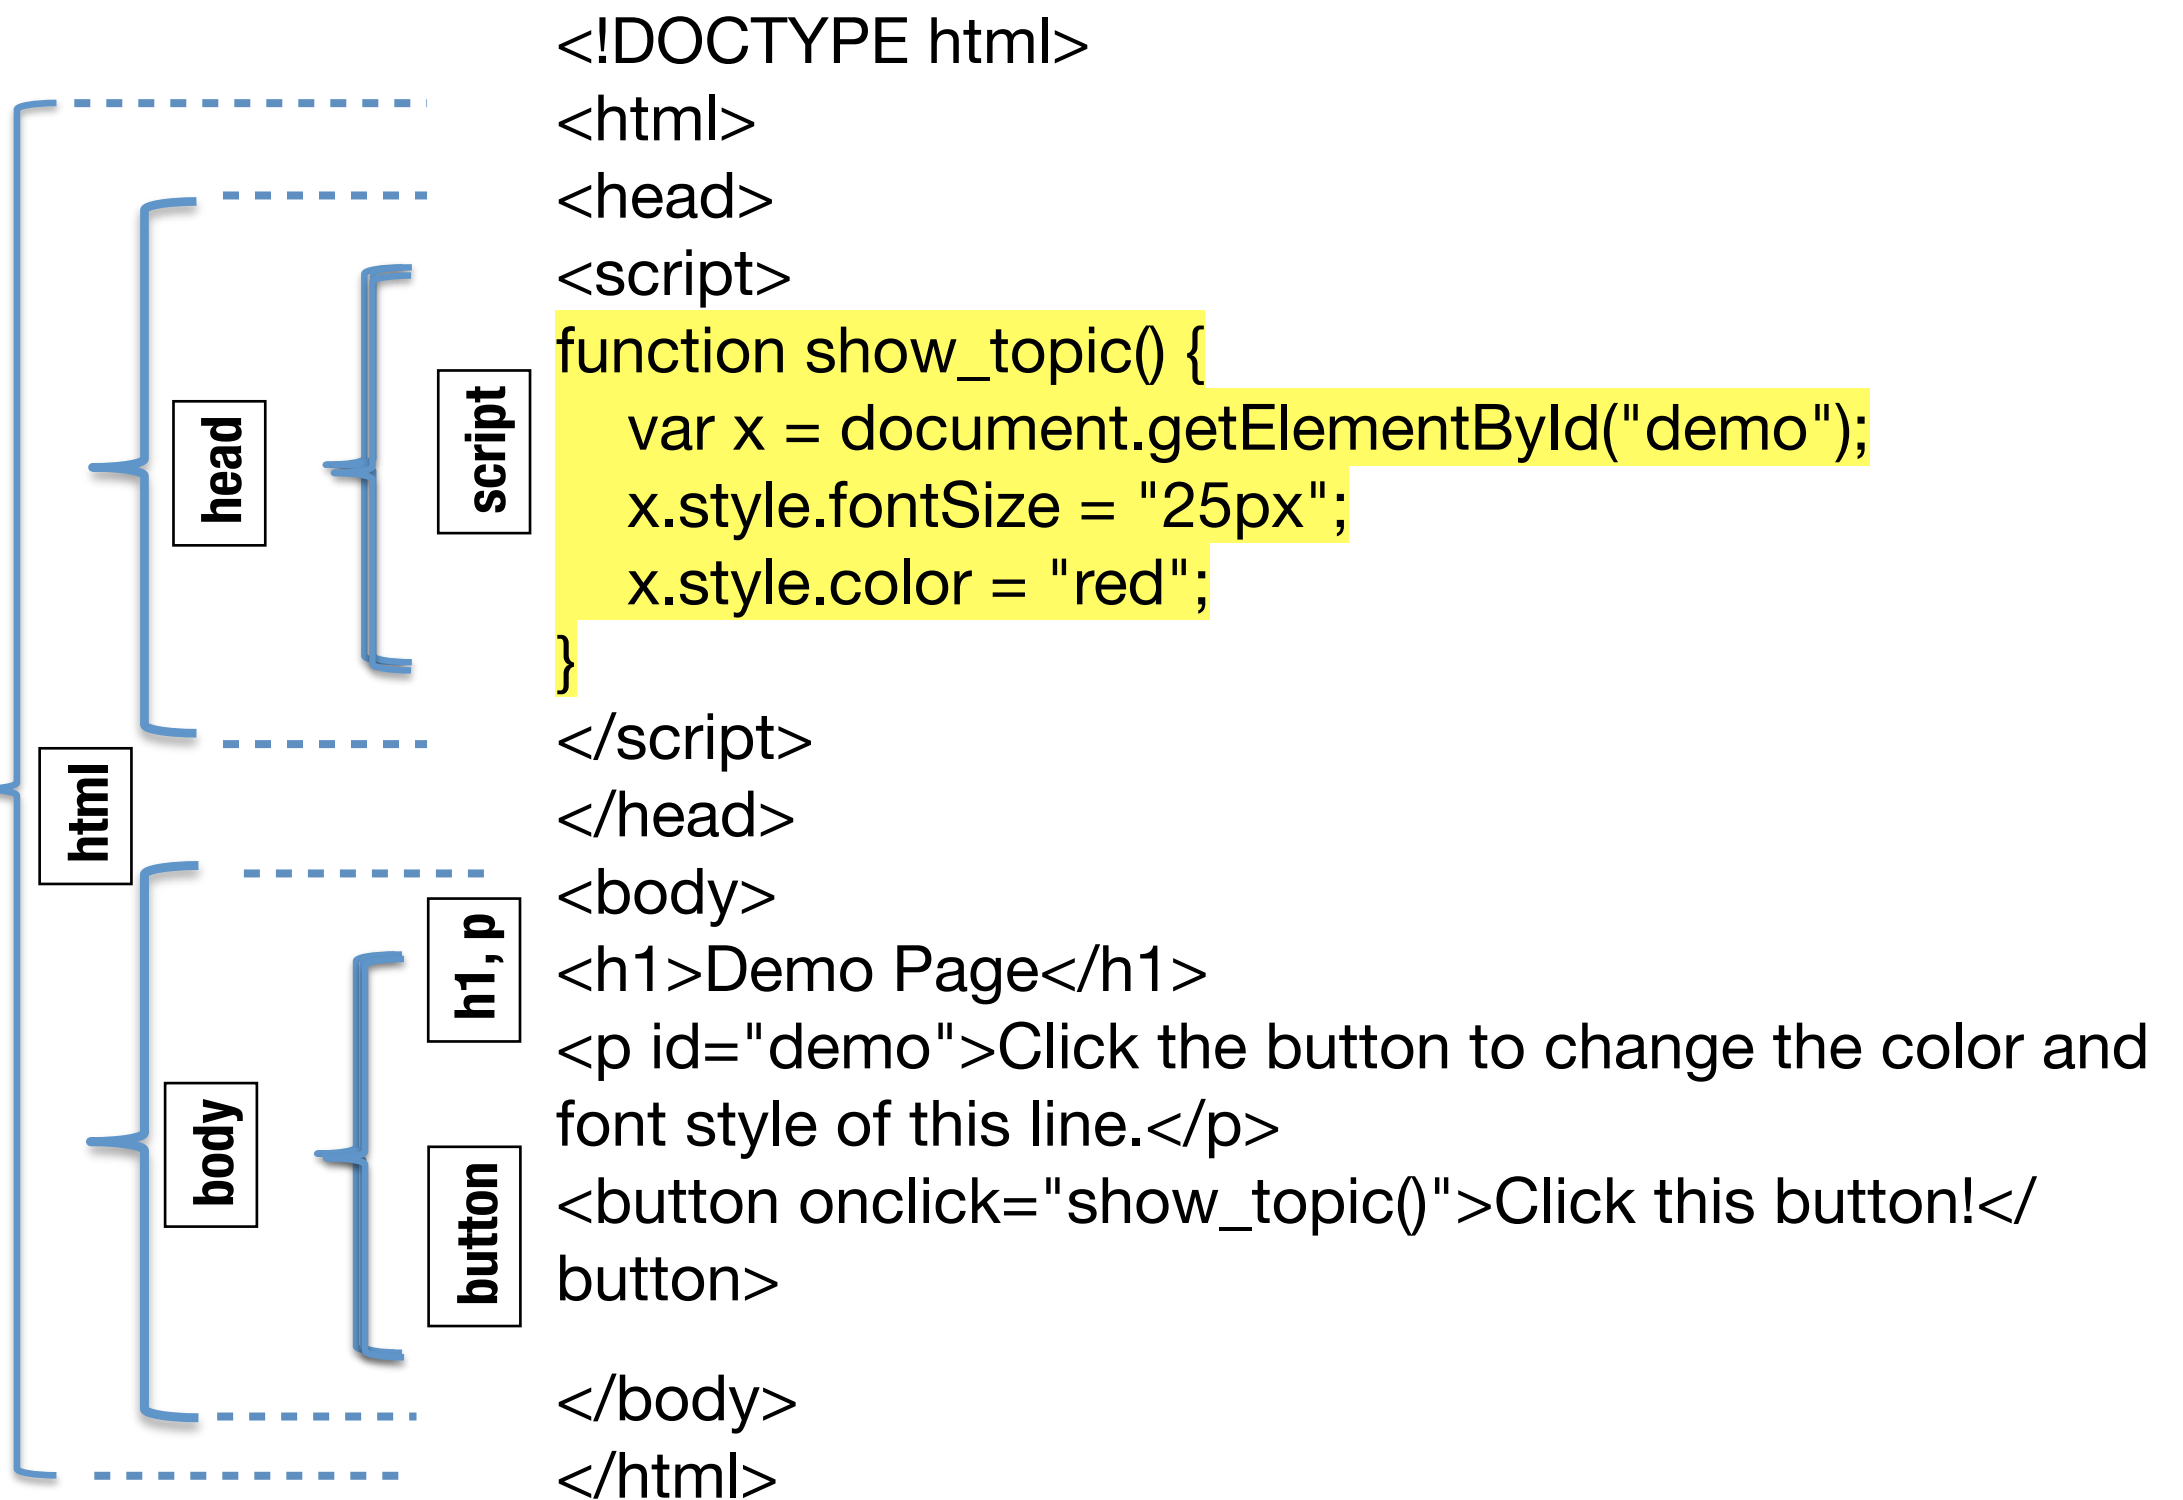

JavaScript Functions that Transform Input into Output

Basic Structure of a JavaScript Function

optional parameters
↓

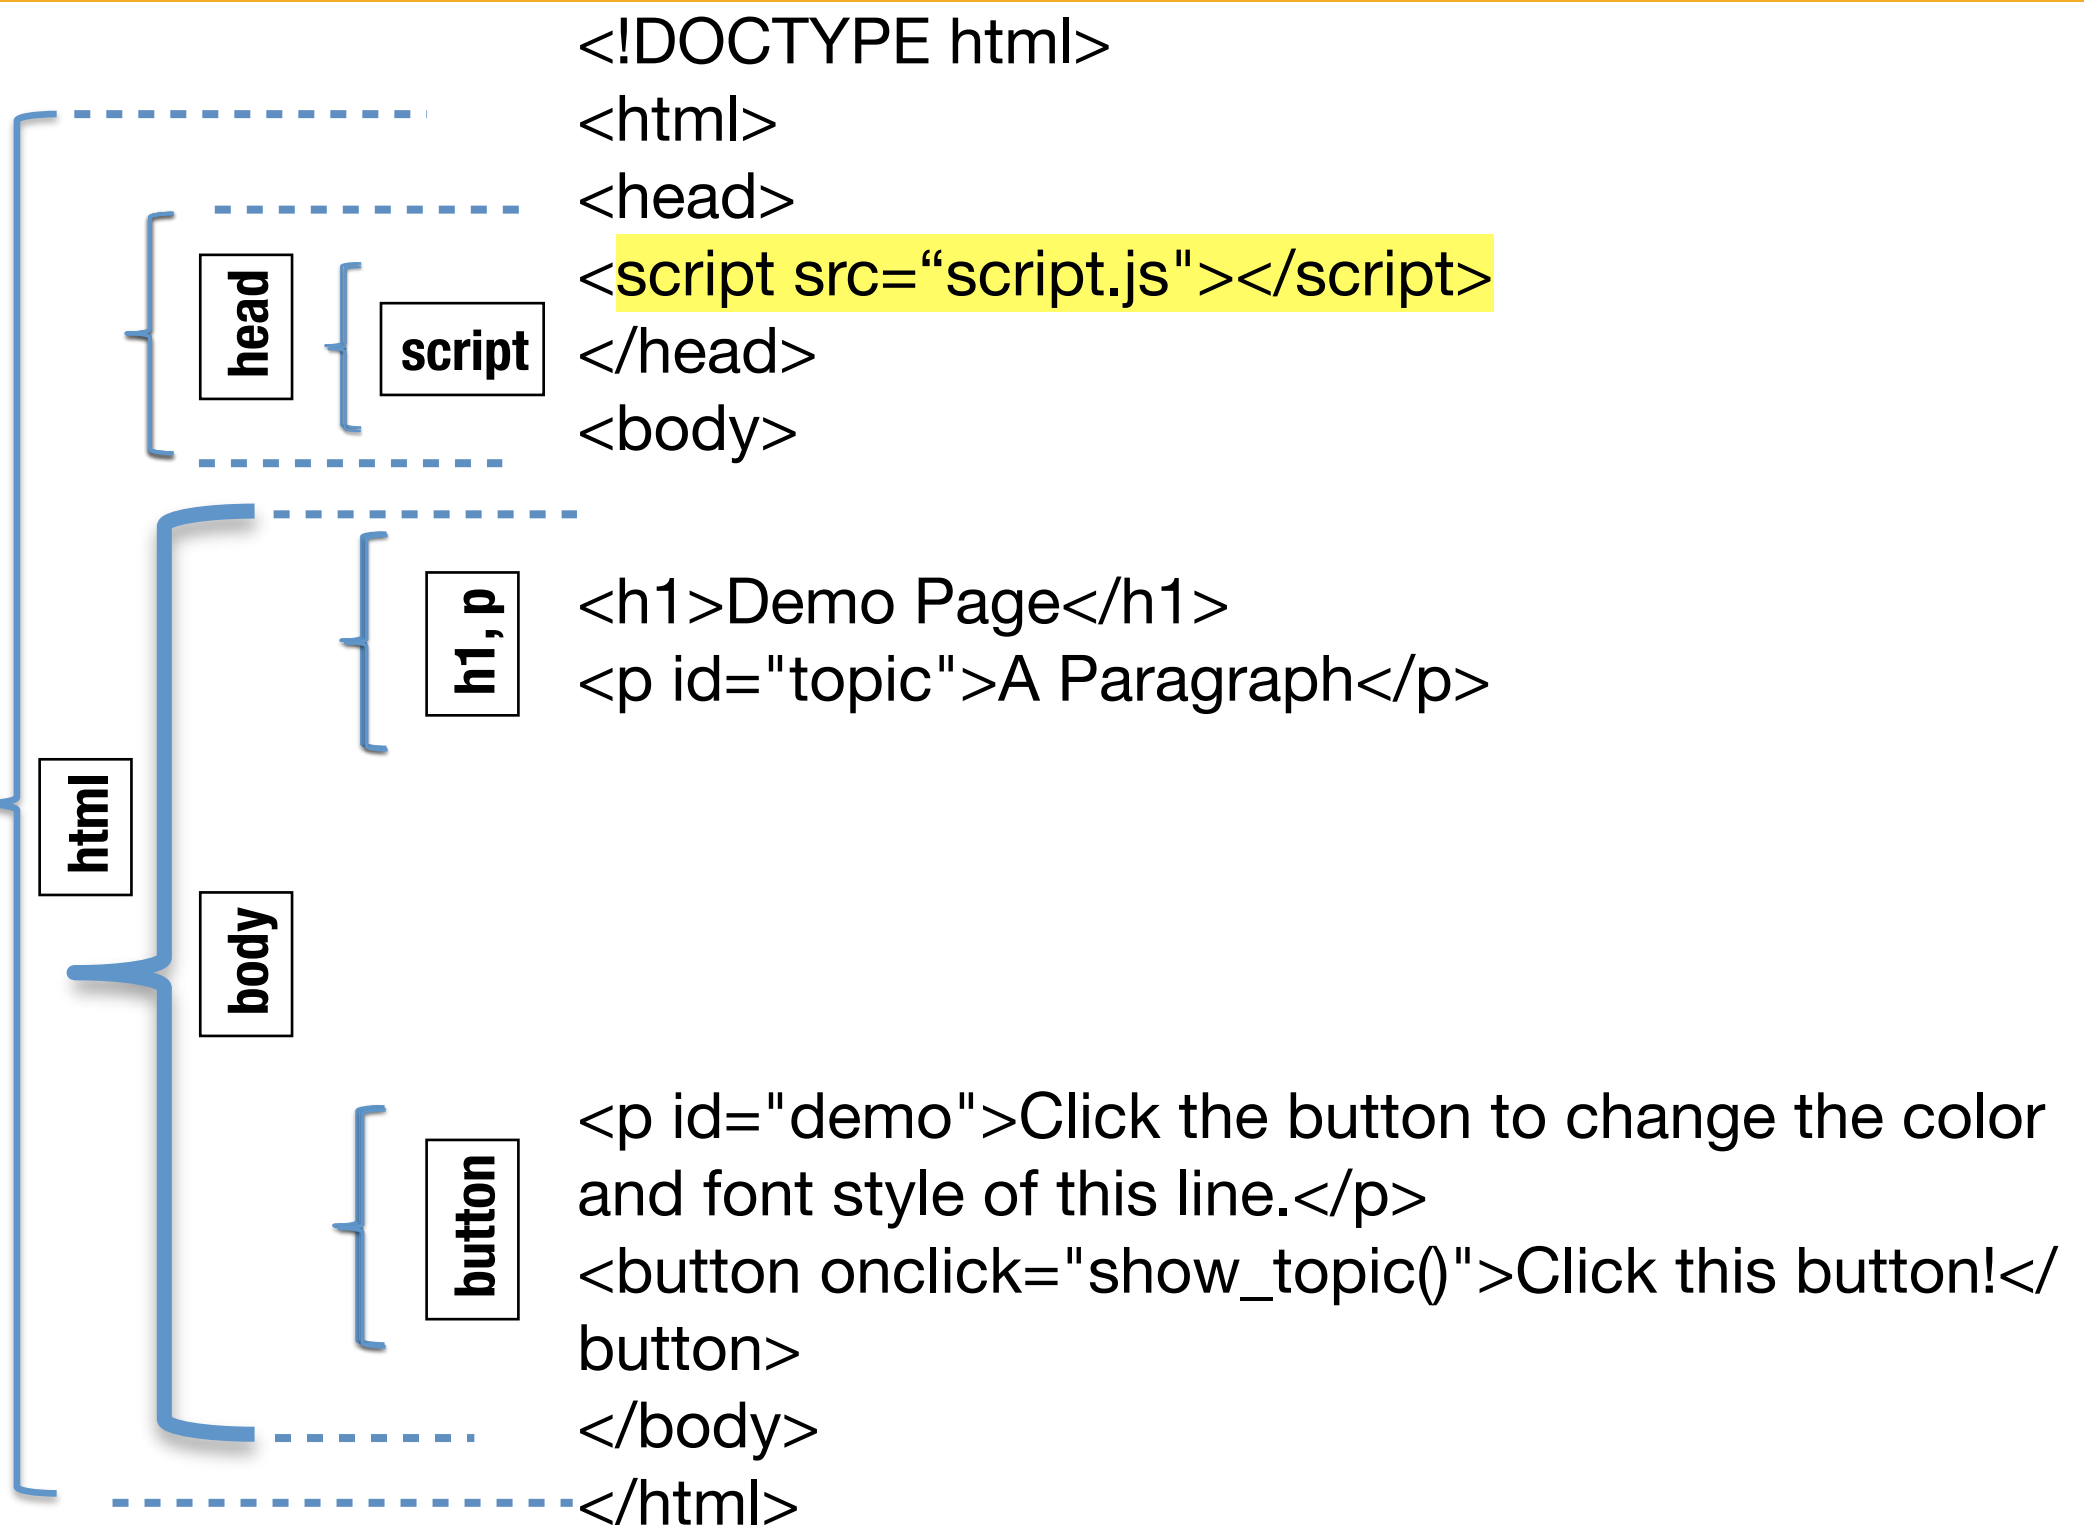

```
<head>  
<script>  
function function_name(parameter1, parameter 2...) {  
    Embed data type variables, input/output commands  
    and logical and mathematical operators in the function to  
    compute and return values.  
}  
</script>  
</head>
```

Code View

**Similar to CSS, JS can be placed in
an External File**

Code View

JavaScript Operations and Commands that Can Enrich the Transformation Process

Basic Logical and Mathematical Operations

- `==` equal (comparing string and boolean)
- `!=` not equal (comparing string and boolean)
- `=` equal (comparing numerical values)
- `>=` greater than or equal to (comparing numerical values)
- `<=` smaller or equal to (comparing numerical values)
- `+, -, *, /, %, &&, ||, !` (addition, subtraction, multiplication, division, modular, and, or, not)

Basic Structure of a JavaScript Function

```
<!DOCTYPE html>
```

```
<html>
```

```
<head><script>
```

```
function addition(a, b) {
```

```
    a = parseInt(a); b = parseInt(b);
```

```
    c = a + b;
```

```
    return c;
```

```
}
```

```
function get_values() {
```

```
    var a = prompt("Enter first number:");
```

```
    var b = prompt("Enter second number:");
```

```
    var z = addition(a,b); alert("The answer is:" + z);
```

```
}
```

```
</script></head>
```

```
<body>
```

```
<button onclick="get_values();" >Click here</button>
```

```
</body>
```

```
</html>
```

Basic Logical and Mathematical Operations

if (condition) {action} else {action}

Examples:

- `if (boolean_var == true) {alert("That is correct");} else {alert("That is incorrect");}`
- `if (string_var != "David") {alert("Not Peter");}`
- `if (num_var >= 8) {alert("The number is greater than or equal to eight.");} else {alert("The number is smaller than eight.");}`

Input/Output Commands without Pop-up

- Entering a variable values through HTML form - e.g.

```
<script>
```

```
function guessInteger() {  
    guess = document. forms['guessForm']['guessValue'].value;  
    if (guess == '') {  
        document.getElementById('demo').innerHTML = "Empty!";  
        return;  
    } else {  
        guess_int = parseInt(guess);  
        if (guess_int) == 20)  
            {document.getElementById('demo').innerHTML = "Right!";} else  
            {document.getElementById('demo').innerHTML = "Wrong!";};  
        return;  
    }  
</script>  
<body>  
<form name='guessForm'>  
    <input name = "guessValue" class="inputField">  
</form>  
<button class='button' onclick='guessInteger()'>Guess an Integer</button>  
<div id='demo'></div>  
</body>
```

More Advanced JS Data Structures: Array and Object

- **Array** - a list of elements e.g.
`var fruits = ["apple", "grape", "pear"];)`
- **Object** - a collection of properties represented in name:values pairs e.g.
`var student {
 student_id: 1155115511;
 student_fname: "Bernard";
 student_lname: "Suen";
 student_major: "EPIN";
}`

Loop

Loop is an iterative programming construct suitable for handling JavaScript array and object.

```
for (initialization; condition; increment) {  
    JavaScript statements  
}
```

Try the following steps:

- 1) `var fruits = [];`
- 2) `for (i=1; i< 10 ;i++) {
 fruits[i] =
 prompt("Enter
fruit:");
}`
- 3) `alert("fruits contain"
+ fruits);`

Can you write a web application using HTML/CSS/JavaScript to compute the addition of a consecutive sequence of integers (e.g. $1+2+3+...+200$)?

Extra points will be given to those students whose web application can handle both odd and even numbers and input and output without pop-up prompt and alert.

$$Y = f(a,b)$$

“You may need a loop to complete this function.”

Functions in JavaScript Programming

- You can look at a function as a mini-system.
- A function is designed to transform input into output.
- You can execute a function within another function.
- A program can be viewed as a collections of functions decomposed into hierarchy of functions to get things done.
- Good programmer looks for patterns in job to be done and abstract common parameters, algorithms, and outcomes to be placed inside a function for code reuse.

The Grammar of JavaScript

- JavaScript is a programming language that can be used to write functions placed inside html or an external file.
- JavaScript can be placed between the <script> and </script> tags inside the <head> section or link to an external file through the script src link.
- JavaScript codes can be understood as a collection of functions that respond to events triggered by internal browser activities and external user interactions.
- JavaScript can be used to manipulate HTML elements and CSS styles.

Problem Set #2

Write a JavaScript program to create a puzzle (feel free to design a math or word puzzle as you wish). Ask the player to input values through HTML form and display the result inside a box (with an ID selector) positioned inside the browser.

Thank You!
